

Title: fabric8 springboot full example

Post Body:

I am trying to figure out how to build a spring boot docker image using fabric8 docker-maven-plugin. The documentation contains bit and bytes and I'm obviously missing something. Does anyone have a full pom.xml example for it?

Accepted Answer: None

Highest Rated Answer:

The fabric8-maven-plugin documentation is pretty hard to dig through if you just want to get started quickly, so here's a quick example for everything you need to get a Docker image built.

First, make sure `docker` is on your path and the Docker daemon is running. Run `docker ps` and ensure a response like this:

CONTAINER ID	IMAGE	COMMAND	CREATED	STATUS	PORTS	NAMES
--------------	-------	---------	---------	--------	-------	-------

Add this to your pom.xml and run this with `mvn clean package docker:build`

```
<build>
  <plugins>
    <plugin>
      <groupId>io.fabric8</groupId>
      <artifactId>fabric8-maven-plugin</artifactId>
```

Note: you'll need additional setup if you want to use the `mvn docker:start` command. You don't have to use it, you can use the standard `docker` command if you'd like.
