

Title: Where docker named volumes are stored?

Post Body:

I have this `docker-compose.yml` file

```
version: '3'
volumes:
  jenkins_home:
services:
  registry:
    image: registry:2
    ports:
      - '5000:5000'
jenkins:
```

As you can see, there is a named volume called `jenkins_home`, now I wonder, where does the data get really persisted?

running `docker inspect infra_jenkins` i got this:

```
...  'Mounts': [
    {
      'Type': 'volume',
      'Source': 'infra_jenkins_home',
      'Target': '/var/jenkins_home',
```

I am running those services on a local docker swarm cluster using `docker stack deploy` command, the cluster is composed of three VirtualBox instances.

Accepted Answer:

You can inspect docker volumes and see detailed informations.

See [docker volume reference](#)

Edit (commented suggestion):

Alternatively (for exact answer) see the [already answered question](#).
