

Title: docker-compose network_mode: 'host' doesn't seem to work

Post Body:

I try to build containers with a docker-compose.yml file :

```
version: '2'
services:
  geonode:
    build:
      context: .
      hostname: geonode
    container_name:
```

In my Dockerfile I run `apt-get update` after `FROM ubuntu:14.04` but it fails: `Could not resolve 'archive.ubuntu.com'`

I tried `docker run -i -t --net=host ubuntu:14.04 /bin/bash` and then run `apt-get update` and it works. So it seems to me that the `network_mode` in docker-compose and the `--net=host` with `docker run` don't work the same way.

Does somebody has an explanation?

Accepted Answer: None

Highest Rated Answer:

It works at least in version 3.7 when doing:

```
services:
  my-app:
    container_name: my-app
    build:
      context: .
    network: host
```

The ports are obsolete as all ports are "exposed".
