

Title: SpringBoot AMPQ on Docker cannot always connect to the queue

Post Body:

I have a SpringBoot app and I want to connect to rabbit mq and read some messages. However I do have an issue that when I deploy the app, sometimes it connects to rabbit instantly and starts working but more often it only tries to connect and tries and finally I receive timeout exception just like that:

```
2018-10-17 09:03:54.460 ERROR 15 --- [ main] o.s.a.r.l.SimpleMessageListenerContainer : Consumer failed to start in 60000 milliseconds
```

I use AWS ECS so my app is running in docker container. Could it be related ?

Here is my configuration where all those environment variables are valid

```
spring.rabbitmq.host=${RABBIT_HOST} spring.rabbitmq.port=${RABBIT_PORT} spring.rabbitmq.username=${RABBIT_USERNAME} spring.rabbitmq.password=${RABBIT_PASSWORD}
```

And my code

```
@Component @Slf4j @RequiredArgsConstructor final class ListingMessageListener { private final BackOfficeService backOfficeService}
```
