

Title: Docker Maven Spotify plugin - Possible to switch to non-secure registry

Post Body:

I'm using the [Spotify Maven plugin](#) to automate the building and deploying of docker images when executing certain maven goals.

However, I'm running a private unsecured registry that is accessible through the following host: server.mydomain.com:5000. However, I can't seem to stop the plugin from forcing a secure push to the repository? It uses <https://server.mydomain.com:5000>.

Is there any way to force the plugin to not use https?

Thanks.

Edit:

Current plugin POM configuration:

```
<plugin>      <groupId>com.spotify</groupId>      <artifactId>docker-maven-plugin</artifactId>      <version>0.4.3</version>
```

Accepted Answer: None

Highest Rated Answer:

This seems to be Docker behavior and not related to the maven plugin you are using, see [this Docker issue](#) that mentions needing to set `--insecure-registry http://server.mydomain.com:5000` when starting the Docker daemon.
