

Title: Resources are missing from JAR file after repackage with spring boot maven plugin

Post Body:

My application uses some additional files which I have inside the resource folder. When I do the regular build with Maven and package my app into JAR, I can see all my resources in case I unzip this archive.

But when I create a docker image I use spring-boot-maven-plugin to make my JAR archive executable. For some reason **my resources aren't being added to the new repacked JAR**. Moreover I **can not even unzip it** because it is corrupted.

Here is the way I set the repackage goal in my pom.xml:

```
<id>prod</id>
    <build>
        <plugins>
            <plugin>
                <groupId>org.springframework
```

I want to add that when I run my image in docker it works fine **but all the needed resources are missing**.

Has anyone run into the same problem? Or maybe you can suggest how to fix it.
