

Title: Spring Boot - Angular - frontend-maven-plugin - Docker = cors error

Post Body:

I created a spring boot (3.0) backend application and used an angular frontend for it. I want to use the frontend-maven-plugin to put the frontend in the static folder of the spring boot application. This works as long as I run the application in a local environment, but when I create a docker image of it, the frontend and backend can no longer communicate with each other due to a cors error.

My docker-compose file looks like this:

```
version: '3.8'
services:
  db:
    image: postgres:latest
    restart: always
    ...
  app:
    image: <dockerImage>
    re
```

In the angular application, the environment.ts contains this: `baseUrl: 'http://localhost:8080/api/'`

How to configure the frontend to be able to communicate with the backend in the docker container? I am not a frontend developer, and this is for learning purposes only :) Thank you for your answers!
