

Title: Why is docker-compose failing with ERROR internal load metadata suddenly?

Post Body:

I've been running docker-compose build for days, many times per day, and haven't changed my DOCKERFILES or docker-compose.yml. Suddenly an hour ago I started getting this:

```
Building frontend-api failed to get console mode for stdout: The handle is invalid. [+] Building 10.0s (3/4) => [internal] 1
```

Things I've tried:

- Running it again
- `docker rm -f $(docker ps -a -q)`
- `docker login`
- Different SDK image

Here is the DOCKERFILE:

```
FROM mcr.microsoft.com/dotnet/aspnet:5.0-buster-slim AS base WORKDIR /app EXPOSE 80 EXPOSE 443 FROM mcr.microsoft.com/dotnet/
```

How can I get my build working again?

Accepted Answer:

mcr.microsoft.com is down at the moment

I'm receiving several different errors when pulling:

```
% docker pull mcr.microsoft.com/dotnet/sdk:5.0 Error response from daemon: Get https://mcr.microsoft.com/v2/: Service Unavaila
```

Highest Rated Answer:

the solution that worked for me is to delete the .docker/config.json by running

```
rm ~/.docker/config.json
```

then `docker-compose up your-services` should work
