

Title: How store container logs from test-containers?

Post Body:

[Test-containers](#) project alllows start docker containiders from compose file. They have [integration with JUnit](#). But when test phase is finished, all I have is maven log - all started containers were removed by that time. It would be nice iff6 for example I run `Application` and `Database` containers 4 times for 4 tests. So maven target folder should contains the following: `target/test-containers/<start-id>/Application.log` and `target/test-containers/<start-id>/Database.log`.

Is there a way to configure test-containers or JUnit or both to redirect log from started containers into some folder?
