

Title: Spring boot connect to docker service mongodb

Post Body:

my spring boot application connected with mongo db. here is the configs:

```
spring.mongodb.embedded.storage.repl-set-name=mongo spring.data.mongodb.host=mongo spring.data.mongodb.port=27017
```

it works fine, but I want to create mongo replicas using docker service, like this:

```
docker service create --name mongo --replicas=3 mongo
```

here is my mongo service

```
53cf3b73a510      mongo:latest      'docker-entrypoint...'  23 seconds ago      Up 23 seconds      27017/tcp
```

So after this my connection to mongodb does not work. I do not want use IP address.

I am using docker-compose and docker network. <https://github.com/armdev/docker-mongo-service/blob/master/docker-compose.yml>

This is also does not work

```
org.mongodb.driver.cluster      : Exception in monitor thread while connecting to server mongo.2:27017      spring.dat
```
