Title: Docker - Timeout value connect was Timeout

Post Body:

I have just started out with Docker, and I am currently trying to run `docker-compose run --rm setup` on a docker-compose.yml file, but whenever I do, I receive the following:

```
Traceback (most recent call last):   File '/home/wickywills/.local/bin/docker-compose', line 11, in <module>      sys.exit(main
```

Pip Freeze

```
backports.ssl-match-hostname==3.5.0.1 boto==2.40.0 cached-property==1.3.0 certifi==2017.4.17 chardet==3.0.4 colorama==0.3.9 cr
```

Seems like this is a common issue, without a real solution. I am running Ubuntu 16.10, and followed the installation instructions as per the Docker documentation. Can anyone advise?

Accepted Answer:

Your error looks similar to [this issue](#). The user closed the issue saying it was fixed by a new release of requests, so I would try upgrading `requests` in your virtual environment:

```
pip install --upgrade requests
```

From the comments, it sounds like you actually need to uninstall and then reinstall, rather than just upgrading.

```
pip uninstall requests pip install requests
```

Highest Rated Answer:

Just in case someone have the same problem as me (same error message) the previous commands were not enough to correct the problem.

There was an old useless urllib3 install inside requests... So I did:

```
rm -rf ~/.local/lib/python2.7/site-packages/requests/packages/urllib3/
```

And it worked!
