Title: Spring Boot 2.2.0 and Maven Plugin trouble

Post Body:

I have two projects. One as follow (say project 1):

```
<parent>     <groupId>org.springframework.boot</groupId>     <artifactId>spring-boot-starter-parent</artifactId>     <version>
```

And second (say project 2) as follow:

```
<parent>     <groupId>org.springframework.boot</groupId>     <artifactId>spring-boot-starter-parent</artifactId>     <version>
```

Both have this:

```
<build>     <plugins>          <plugin>                    <groupId>org.springframework.boot</groupId>          <artifactId>spring-
```

Well, project 1 is running fine. I can see the Spring Plugin v. 2.0.0.BUILD-SNAPSHOT in my .M2 repo folder.

Project 2 is throwing the follow error:

```
*************************** APPLICATION FAILED TO START ***************************  Description:  An attempt was made to call
```

When I try to force a version to Maven plugin in project 2 POM, I see the classic yellow warning saying I'm overriding the managed version 2.2.0.BUILD-SNAPSHOT but there's no 2.2.0 version to Maven Plugin.

The strange is that I'm was able to run this project until yesterday....

Can someone tell me what are going wrong?

NOTE: When I downgrade project 2 to 2.0.3.RELEASE all start to work.

Accepted Answer: None

Highest Rated Answer:

When we use any dependencies(other than Spring boot provided) in our project, we need to provided spring transaction core plug-in to resolve this issue.

Kindly try the below dependency and version is compatible to your Spring Boot version.

Spring Transaction Core Dependency:

```
<dependency>             <groupId>org.springframework.plugin</groupId>             <artifactId>spring-plugin-core</artifactId>
```
