Title: docker-compose use other container as DNS

Post Body:

I have a docker-compose file like:

```
services:
  dns-server:
    # ...
  other:
    image: ubuntu
    dns: dns-server
```

Is there any way to make the `other` container use `dns-server` as its DNS server without hardcoding the IP of that container? Using the container name doesn't give me an error but it doesn't seem to work.
