Title: docker-compose - Spring boot doesn't connect to postgres unless network_mode: host
Post Body:

Trying to run integration tests locally on Mac using docker-compose The only way I can connect application to database is using network_mode: host.

It could be this way but I can't reach the application endpoint as in a Linux env by: curl localhost:8080/blabla

I've tried all the Stack Overflow answers and many many configurations and different versions of docker-compose.yml but none worked so far.

Always the same problem unless network host.

```
version: '3' services:   app:    build:      context: .    expose:      - '8085'    network_mode: host    depends_on:
```
