Title: No goals have been specified for this build.
Post Body:

I'm trying to run Maven in Docker.

So I pulled the image from her https://hub.docker.com/_/maven/.

```
docker pull maven
```

However, when I run it:

```
docker run maven
```

I get:

```
[ERROR] No goals have been specified for this build. You must specify a valid lifecycle phase or a goal in the format <plugin-
```

I don't have experience with Maven so I don't understand what's causing this issue.

The Docker container only has Maven installed, but it's not running it so I don't understand how Maven can throw an error.

Accepted Answer: None
Highest Rated Answer:

You need to define `clean install` in Goal tab after you click `build as maven`.
