Title: docker-compose scale service with independent volumes
Post Body:

I'm trying to write a compose-file using a service (node) that I'd like to scale to 3 containers. This service has a volume to be bond to my local system for persistence, but I'd like the different tasks having different binding on my system ? I tried to use the template `{{.Task.Slot}}` inside my docker-compose.yml as shown below, but I cannot figured out to make it work...

```
version: '3.2' services:      node:       build:        context: ./node        volumes:        - nodeVol:/data
```

Any idea of what went wrong ?
