Title: memcached not working in docker-compose

Post Body:

I have problem with memcached in docker-compose. This is docker-compose.yml:

```
nginx:    container_name: nginx    image: nginx:latest    ports:        - 127.0.0.2:8000:80    volumes:        - ./htdoc
```

and this is my php code:

```
error_reporting(E_ALL & ~E_NOTICE);  $memcached = new Memcached;   $memcached->addServer('0.0.0.0', 11211);  echo '<pre>'; pri
```

and result is:

```
Array (    [0] => Array        (            [host] => 0.0.0.0        [port] => 11211        [type] => TCP
```

Why memcached cant see server? (getStats returned nothing) Command 'docker ps' return list where it`s running docker memcached:lastest as port '0.0.0.0:11211->11211/tcp'. Sorry for my english.

Accepted Answer: None

Highest Rated Answer:

Just replace host `0.0.0.0` to `memcached`

Host `memcached` link to IP of memcached container.
