Title: Dockerfile maven plugin not working

Post Body:

I am using 'dockerfile-maven-plugin' to build & push dockerfiles in maven as docker-maven-plugin is deprecated. However, when I use 'docker-maven plugin', images are build but on using 'dockerfile-maven-plugin' I get below error:

    --- com.spotify.docker.client.exceptions.DockerException: pull access denied for imagename, repository does not exist or may require 'docker login'

I did docker login, added user to group, installed latest docker version (thinking it requires latest), updated `settings.xml` with my credentials but still the same error. Any help regarding this will be very helpful.

Accepted Answer: None

Highest Rated Answer:

    <configuration>   <repository>dockerregistry.xxx.dev/xxxx</repository>   <tag>O-SANPSHOT</tag>   <pullNew

Add `<pullNewerImage>false</pullNewerImage>` inside configuration tag. generally it will try to pull the image from repository. Because of the your local image won't be recognized. This solved my issue.
