Title: Configure Docker container for spring boot micro services
Post Body:

I am new in docker, I want to know how to install dependency locally in maven while using docker compose yml file.

Like, I have 3 micro services and those I configured in **docker-compose.yml** file but I want one dependency to be installed in local maven using maven install so that I can use that dependency in other micro services by importing.

Is this possible ?

Thanks in advance.
