Title: Spotify docker maven build multiple images
Post Body:

I am using spotify's Docker maven plugin and want in to build two different images, one is a database (MariaDB) and the other is a Java EE image (Glassfish).

I have managed to get Maven to build the images OK when ran seperately however when I try and run both in the same POM file it will only create the first image.

I have tried putting two configuration sections within the single plugin and get the error below:

```
[ERROR] Non-parseable POM C:\Users\607819425\Documents\InteliJProjects\feature_docker\pom.xml: Duplicated tag: 'configuration'
(position:START_TAG seen ...\r\n ... @300:32) @line 300, column 32 -> [Help 2]
```

Pom file with 2 configuration tags in one plugin

```
        <plugin>            <groupId>com.spotify</groupId>            <artifactId>docker-maven-plugin</artifactId>
```

And Also with two seperate plugins it only every builds the first image.

Two Plugin POM:

```
<plugin>            <groupId>com.spotify</groupId>            <artifactId>docker-maven-plugin</artifactId>            <vers
```

Any info you could give would be great!

Accepted Answer:

I Switched to Fabric8.io's version of the plugin in the end as multiple images are supported.

Fabric 8 Docker Maven Plugin
